

Text Input

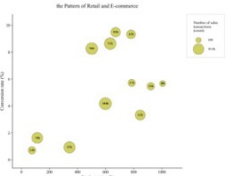

A data visualization of 250 restaurants reveals key patterns in the relationship between pricing, ratings, and foot traffic across different cuisine types. Mid-priced establishments (\$15-35 per entrée) create a "sweet spot," clustering around 4.2-4.6 star ratings where customers perceive optimal value. Budget restaurants under \$12 show dramatic rating variation (2.8-4.8 stars), indicating execution trumps price at the lower end. Notable outliers include high-end restaurants (\$80+ per entrée) maintaining perfect 4.9-5.0 ratings with strong traffic, demonstrating successful premium positioning. Asian fusion restaurants exhibit remarkable consistency (4.3-4.7 stars) across all price ranges, while traditional American diners suffer rating declines when pricing exceeds \$25, suggesting customer resistance to premium comfort food pricing.
